2013 10th China International Forum on Solid State Lighting

(ChinaSSL 2013)

Beijing, China
10-12 November 2013
# Table of Contents

A Novel Process Obtaining Silicone Dome Lens for Wafer Level LED Packaging .......................................................... 1

Thermal Behavior of Flip Chip LED Packages using Electrical Conductive Adhesive and Soldering Method ......................... 4

A Fully-integrated Compact LED Module with Inductor-less and Capacitor-less LED Driver .................................................. 8

A New Coating Configuration with Two Phosphor Layers Laminated for White PC-LEDs ....................................................... 12

A New MOCVD Platform, Prismo D-BlueTM, for High-throughput GaN LED Production ..................................................... 16

Self-Adaptive Remote Phosphor Coating for pc-LEDs Packaging by Self-Exposure Slurry Method ........................................ 21

A Study on the Feasibility of LED in the Wound Healing Application .............................................................................. 25

Study of Defect Density and Aging Properties of GaN LEDs .............................................................................................. 27

An Improved Electrophoretic Deposition Method for Wafer Level White pc-LED Array Packaging ........................................ 31

Analysis of LED Lighting Product Certification & Suggestion on Photobiological Safety ..................................................... 34

Application of Switched Capacitor Converters in Solid State Lighting .................................................................................. 38

Automatically Controlling Illuminating Light Color in the Presence of Ambient Light ......................................................... 44

Cause Analysis on Highly Depreciated Indoor LED Product in CSA020 ................................................................................ 48

Development of High Quality and Low Defect Density Semipolar and Non-polar GaN Templates ............................................ 52

Building Dynamic Models of LED Lamps by System Identification Methods ........................................................................ 56

Evaluation on the Non-visual Biological Effects of Light Sources .......................................................................................... 61

An Accelerated Lifetime Test Method for DC or AC Supplied Electronic Control Gear for LED Modules of Outdoor LED Lighting Products ................................................................................................. 65

Freeform LED Lens Design for Uniform Rectangular Illumination using a New Source-Target Mapping ................................ 69

Healthy Lighting Design with Low Retinal Blue Light Hazard .............................................................................................. 73

Indoor Localization Based on Optimization via Visible Light .............................................................................................. 77

Investigation of Color Shift of Plastics Lenses in LED-Based Products .................................................................................. 81

Kerf-free Wafer Slicing and Thinning for Semiconductor Applications .................................................................................. 85

LED Encapsulation and Integration with Film Assisted Molding Technology ......................................................................... 89

Optimization of Light Efficacy and Angular Color Uniformity by Hybrid Phosphor Particle Size for White Light-emitting Diode .................................................................................................................. 95

Panel Level Packaging for LED Lighting .......................................................................................................................... 100
Effect of LED Supplemental Lighting System on the Growth of Pea Shoots ................................................................. 104
Design and Implementation of Fine Pitch COB LED Display .......................................................................................... 108
Synthesis and Luminescence Properties of Blue Light Excited Red Phosphor SrLa2 - xZnO5:Eu x (x = 0.001 ~ 0.2) for White LED .................................................................................................................. 112
Highly Improve Photochemical and Thermal Stability of Quantum Dots by Growing a Core-in-Matrix Hetero-Structure ........ 115
The Comparative Study on Thermal Performance and Life Time of Liquid Cooling LED Bulb Lamp and Traditional LED Bulb Lamp ............................................................................................................ 122
The Mechanism of Modification Effect of Moo3 on Al Anode of Top-Emitting Organic Light-Emitting Device .............. 125
Thermal Characterization of a Printed Circuit Board with Thermal Vias for the Application of High Brightness Light-Emitting Diodes .............................................................................................................. 128
Thermal Transient Testing of LEDs: A Technique Enabling the Design and Manufacturing of Reliable SSL Products ........ 132
Voltage-Temperature Coefficient Analysis and Testing of High Power Light-Emitting Diodes ........................................ 137
Optical Characterization of a Light Bulb with the Waffle Pack LED WLP Module .......................................................... 142
Integrated Analog Dimming Controller for 0-10V Dimming System ........................................................................ 147
Study on Thermal Degradation of High Power LEDs during High Temperature and Electrical Aging ....................... 150
Validation of The Methodology of Lumen Depreciation Acceleration of LED Lighting ..................................................... 154
SMT Practices with Compact Pad Size LEDs .................................................................................................................. 158
Methods for Assessing the Colour Fidelity of Light Sources ............................................................................................ 163
White LED Light Emission as a Function of Current and Junction Temperature .......................................................... 166
Cross-Cultural Similarities in the Visibility of the Stroboscopic Effect .......................................................................... 170
Cost-effective Solid State Lighting based on GaN-on-Si Technology ............................................................................ 174
A Novel Self Bias Supply Scheme in LED Lighting ........................................................................................................ 178
An Optimal Peak Current Mode Control Scheme for Critical Conduction Mode (CRM) Buck PFC Converter ............ 182
Environmental Influence on Background Luminance Preference of Computer Use at Home ......................................... 190
Thermal Analysis and Optimization Design of LED Streetlight Module ..................................................................... 193
Key Technology Development and Future Prospect for High-Voltage Light Emitting Diodes .................................... 202
Thermal Analysis for Silicon-based Integration of LED Systems .................................................................................. 206
