
San Jose, California, USA
14-17 October 2018
# TABLE OF CONTENTS

## Session M-I - Monday, October 15

M-I.1: Electrical Performance Analysis of Glass Interposer Channel and Power Distribution Network .............................................................................................................3

M-I.2: Electrical Analysis of EMIB Packages ...............................................................................................................................7

M-I.3: Multi-Die Polyolithic Integration Enabled by Heterogeneous Interconnect Stitching Technology (HIST) .....................................................................................11

## Session M-II - Monday, October 15

M-II.1: Signaling Analysis and Optimal Channel Data Rates for High-Performance FPGA Interfaces ..........................................................................................................................17

M-II.2: Combined Optimization of FFE and DFE Equalizations .................................................................................................................21

M-II.3: Effective Link Equalizations for Serial Links at 112 Gbps and Beyond ...........................................................................25

M-II.4: Statistical Modeling of Non-Linearity in Decision Feedback Equalizer-Based Mixed-Signal Receivers .................................................................................................29

## Session M-III - Monday, October 15

M-III.1: Signal/Power Integrity Tradeoffs in Automotive SoC Package Design (LPDDR4 Case Study) ..........................................................................................................................35

M-III.2: Impacts of Anisotropic Permittivity on PCB Trace and Via Modeling .............................................................................39

M-III.3: Design of Low-loss Transmission Lines with Common Mode Suppression for Packages ..........................................................................................................................43

M-III.4: Autoencoding Density-Based Anomaly Detection for Signal Integrity Applications ..........................................................................................................................47

## Session M-IV - Monday, October 15

M-IV.2: Stochastic Collocation with Non-Gaussian Correlated Parameters via a New Quadrature Rule ...........................................................................................................57

M-IV.3: Computation of a Subset of X-Parameters Using the Adjoint Method ..................................................................................61

M-IV.4: Automated Generation of All-Digital I/O Library Cells for System-in-Package Integration of Multiple Dies ..........................65
Poster Session I & Industry Reception - Monday, October 15

P-I.1: A New Method to Calculate Cascaded S-parameters ..........................................................71
P-I.2: Statistical Approach to Analyze Duty Cycle Jitter Amplification in NAND Flash Memory System ...........................................................................................................75
P-I.3: Crosstalk Associated with the Mingling of Current Returned Paths through the Vertical Bonding Structures .......................................................................................79
P-I.4: Effects of Manufacturing Variations on Ultra-High-Speed Integrated Waveguide Memory Interconnects ....................................................................................................83
P-I.5: Balanced Single-Ended Signaling (BASES) Scheme for Wire-Efficient High-Bandwidth Wireline Interface ..................................................................................................87
P-I.6: Guard Band Minimization via Impedance Reduction and Dynamic Voltage Scheduling Schemes ......................................................................................................................91
P-I.7: SoC On-die Decap Optimization for PDN in LPDDR ................................................................95
P-I.8: 3D Electromagnetic Modeling of Connector to PCB Via Transitions ..................................99
P-I.9: Enhanced Data Transfer for Multi-Loaded Source Synchronous Signal Groups .................103
P-I.10: Design and Analysis of Receiver Channels of Glass Interposers for 5G Small Cell Front End Module ..................................................................................................................................107
P-I.11: A Physics Based Study on Charge Delivery Delay of a Power Distribution Network .................................................................................................................................111
P-I.12: Efficient and Accurate Multi-Dimensional Layered Media Green’s Function Interpolation Algorithm for the Analysis of Printed Circuit Boards ................................................................115
P-I.14: Vertical and Horizontal Transitions of Substrate Integrated Waveguides Within a Multi-Layered PCB for High Speed Signaling Applications ........................................................................123
P-I.15: E-Band 3-D Printed Antenna Measurement and Calibration Using VNA and Single Frequency Extender ...............................................................................................................127
P-I.16: Single Sided Coplanar Waveguide .....................................................................................131

Session T-I - Tuesday, October 16

T-I.1: Jitter and Eye Estimation in SerDes Channels Using Modified Polynomial Chaos Surrogate Models ....................................................................................................................137
T-I.2: A Fast Channel Simulation Framework Based on Hierarchical Waveform Representations .............................................................................................................................141
T-I.3: Link BER Estimation for ADC-based SerDes Design with IBIS-AMI Simulations ............145

Session T-II - Tuesday, October 16

T-II.1: Method to Model Vccin Feedthrough Noise in Multi-Domain Fully Integrated Voltage Regulators ..................................................................................................................................151
T-II.2: Thermal-Power Delivery Network Co-analysis for Multi-Die Integration .......................155
T-II.3: Design and Analysis of Interposer-level Integrated Voltage Regulator for Power Noise Suppression in High Bandwidth Memory I/O Interface ............................159
T-II.4: Cost Space Evolution for PDN Synthesis ..................................................................................163
T-II.5: Power Noise Sensitivity of Micro-Processors with Adaptive Clocking ............................167

Session T-III - Tuesday, October 16

T-III.1: A Generalized Finite-gap Lumped-port Model ........................................................................173
T-III.2: MoM-HB Algorithm for prediction of High Voltage Interference in Automotive Active Circuitry ...........................................................................................177
T-III.3: Parallel-in-Space-Time Analysis of Electromagnetic Interference in Electronic Enclosures ........................................................................................................181
T-III.4: Accelerated Electromagnetic Analysis of Interconnects in Layered Media Using a Near-Field Series Expansion of the Green's Function ........................................................................185
T-III.5: A New Efficient Domain Decomposition Method for Highly Irregular Via Patterns ........................................................................................................189

Session T-IV - Tuesday, October 16

T-IV.1: Robust Temperature and Humidity Dependent Electrical Package Material Characterization ...............................................................................................................195
T-IV.2: Broadband Antenna Probe for Microwave EMC Measurements ...........................................199

Poster Session II - Tuesday, October 16

P-II.1: Non-linear DC Offset of LDO due to RF Noise ........................................................................205
P-II.2: Eye-width and Eye-height Estimation Method based on Artificial Neural Network (ANN) for USB 3.0 ........................................................................................................209
P-II.3: Reinforcement Learning-based Optimal On-board Decoupling Capacitor Design Method ..................................................................................................................213
P-II.4: Characterization of Printed Circuit Board Interconnect Transmission Lines Using Multiline Thru-Reflect-Line Calibration Up to 110 GHz ..................................217
P-II.5: On Modeling and Measurement of Grounded Coplanar Waveguide for Automotive Radar Applications ........................................................................................................221
P-II.6: Via Noise Coupling Mitigation in Packaging ...........................................................................225
P-II.7: On-Die Decoupling Capacitor Optimization for DDR IO Interface Power Rail .......229
P-II.8: A Comprehensive Signal Integrity Study of Differential Pairs Routed within a PCB Via Field ...........................................................................................................233
P-II.9: 112G PAM4/56G NRZ Interconnect Design for High Channel Count Packages .......237
P-II.10: Broadband Full-Wave BIE Impedance Characterization of 3-D Interconnects ............241
P-II.11: Inductance Models of 8-Terminal Decoupling Capacitors .................................................245
P-II.12: Modeling Metal Surface Roughness with a Single Parameter ...........................................249
P-II.13: Critical Assessment of Linear Redriver for PCIe Server Channel Successful Implementation ........................................................................................................................................253
P-II.14: Modeling Voice Coil Actuators with Recurrent Neural Network ..............................................................................................................................................................257
P-II.15: A Hybrid Algorithm for Electromagnetic Optimization Utilizing Neural Networks ........................................................................................................................................................................................................261
P-II.16: Efficient Construction of Interconnect Passive Macromodels Through Segmented Analysis ........................................................................................................................................................................................................265

Session W-I - Wednesday, October 17

W-I.1: Temperature Impact on Surface Roughness Modeling for On-Package High Speed Interconnects ..............................................................................................................................................................271
W-I.2: Critical on-Board Crosstalk Path Optimization for RFSoC with Multiple Gsps RF ADCs and DACs ........................................................................................................................................................................................................275
W-I.3: Analysis of Noise Coupling and Timing Error in Silicon Bridge Application ........................................................................................................................................................................................................279

Session W-II - Wednesday, October 17

W-II.2: Design of Compact Integrated Lumped-Element Coupled-Resonator Filters ........................................................................................................................................................................................................289
W-II.3: Dual-band Monopole Antenna Feeds for Substrate Integrated Waveguides ........................................................................................................................................................................................................293

Session W-III - Wednesday, October 17

W-III.1: Receiver Behavior Modeling based on System Identification ........................................................................................................................................................................................................299
W-III.2: Transient Simulation for High-Speed Channels with Recurrent Neural Network ........................................................................................................................................................................................................303
W-III.3: Behavioral Modeling of Steady-State Oscillators with Buffers Using Neural Networks ........................................................................................................................................................................................................307
W-III.4: Bayesian Active Learning for Uncertainty Quantification of High Speed Channel Signaling ........................................................................................................................................................................................................311
